GitHub: github.com/CamerenGreen
My Portfolio: camerengreen.netlify.app

EDUCATION

University of Kansas | Bachelor of Science (B.S.) in Computer Science Expected May 2027

Relevant Coursework: Embedded Systems, Data Structures & Algorithms, Software Engineering, Probability and Statistics, Machine Learning, Intro to Theory of Computing

Activities: National Society of Black Engineers (NSBE) Scholar

SKILLS

Languages: Python, Java, C, C++, {Java/Type}Script, {My}SQL, Rust, HTML/CSS
Autonomous Systems: LiDAR, Embedded Systems, Sensor Integration, Computer Vision, Real-time Processing
AI/ML & Data: PyTorch, Machine Learning, LLMs, Prompt Engineering, Databricks, Data Pipelines
Cloud & DevOps: AWS (IAM, EC2), Docker, Kubernetes, Linux/Unix, Git/GitHub
Frameworks & Tools: Visual Studio Code, Splunk, Three.js, Redux.js, Node.js, Agile/Scrum

PROFESSIONAL EXPERIENCE

Cybersecurity Intern | Brites Technology Solutions Sept 2025 - Dec 2025
Bangkok, Thailand (International Experience)

- Built a real-time alerting backend service that cross-references detected data against a pre-existing database, logging matches.
- Reduced alert generation time from manual batch processing (hours) to seconds, granting a 99.999% optimization
- Wrote optimized SQL and Python and used internal REST APIs to send data alerts to databases
- Created live proof-of-concept deployments under the guidance of the technical leadership team

TECHNICAL PROJECTS

Self-Operating LiDAR Braking System | Autonomous Vehicle Prototype Jan 2025 - Apr 2025

- Engineered an embedded system prototype implementing autonomous emergency braking functionality using LiDAR sensor data
- Developed real-time object detection and distance calculation algorithms for safety-critical braking decisions
- Integrated sensor fusion techniques to process LiDAR point cloud data for obstacle recognition and collision avoidance

Flick Picker | ML-Powered Chrome Extension Jan 2024 - Present

- Built a full-stack Chrome extension utilizing a machine learning model to generate personalized media recommendations from watch history
- Developed and trained ML models for content-based filtering and user preference prediction

TrainTrace BKK | Full-Stack Train Routing App Nov 2025 - Present

- Built a Python script to extract 500+ data points from official Bangkok BTS and MRT timetables.
- Used obtained data to develop an app that tracked and optimized train routes, as well as calculated fare costs.
- Applied pathfinding algorithms for optimizing train routes, considering transfer times and walking distances, along with fare calculation

AWS Identity and Access Management Service Jun 2025 - Present

- Designed and implemented IAM policies enforcing least privilege access for users, groups, and roles.
- Architected secure cloud infrastructure following AWS security best practices and compliance standards

Algorithm Visualizer | Interactive Learning Platform Mar 2025 - Aug 2025

- Created an interactive web application visualizing sorting, pathfinding, and graph algorithms using Three.js 3D animations
- Implemented efficient data structures, including custom hash tables with chaining for O(1) average-case operations

VisionEQ | Video Equalizer Web Application Apr 2025

- Designed and implemented a web application that allows users to control audio volume and frequency using hand gestures via camera object detection.
- Optimized scripts and utilized APIs to streamline all use cases while maintaining <50ms latency
